Predict with model2

```
pred2 <- predict(model2, newdata)
```

Compare adjusted r-squared values

```
data.frame('model1' = summary(model)$adj.r.squared, 'model2' = summary(model2)$adj.r.squared)
```

```
##      model1    model2
## 1 0.7078062 0.7443692
```

In comparing the predictions, we find the result from model2 more reasonable as it is within the range of Crime values in the data set.
